

PROJECT SUMMARY

The scope of the Transecare project is oriented towards people suffering from a **chronic disease and/or from degenerative disabilities due to age**.

The objective of the Transecare platform is to support these people through the aid of an ICT platform, **focusing on real needs, and real life situations**.

The Transecare project investigates **the use of new technologies for supporting daily activities** in the home environment.

Special attention is given to the mobility of the patient/user. **“Personal network”** concepts (self-configuring and self-organising networks of heterogeneous personal devices) for patients will be designed.

IMPORTANT THEMES

1. The creation of a **“transparent home environment”**, offering to people an “open window” on the world in their home environment through the aid of ICT.
2. The creation of a **“transparent data exchange platform”**, offering the adequate information to both professional and non-professional care givers.
3. The creation of a **“transparent network environment”** offering support to both domotica and mobility aspects.

PROJECT COURSE

The Transecare proposal thus builds on three important pillars, each involving an in-depth research of several involved technical and non-technical items.

The study on the **domainanalyses** and the business modeling activity will offer the overall framework for the Transecare platform construction.

In the third project year **a proof-of-concept small scale field trial** will be installed offering an integration of some of the services developed in the project.
